

IP AS A TOOL FOR ECONOMIC DEVELOPMENT

* Andrew Beale

ABSTRACT

This paper addresses the issue of Intellectual Property (IP) as a tool for economic development. The Welsh Assembly Government has articulated the vision of a knowledge rich economy for Wales. With IP at its core, this vision proposes an economy driven by an indigenous University research base that is underpinned by science, technology, engineering, and mathematics. This paper discusses the issue of whether the current infrastructure for science and technology research in Wales is too weak and fragmented to successfully drive a knowledge economy. An important policy initiative establishing a new sector based approach to economic development in Wales is reviewed. The initiative is assessed in terms of Welsh universities' strength in patenting their research. The current interface between the Welsh Universities and the indigenous micro, small, and medium sized enterprises is explored for evidence of commercially successful interaction.

IP Wales®

IP Wales is a £3.5m award winning business support initiative operated by the Law School at Swansea University.

In the first phase of this European Union (EU) funded operation,¹ its mandate was to provide Welsh micro, small and medium sized enterprises (mSMEs) with the knowledge and financial means to commercialize their IP assets. IP Wales was to pursue this mandate by focusing on three main objectives. The first was to raise awareness and understanding of IP amongst mSME businesses. The second was to enable businesses to make informed commercial choices about protecting their IP assets. The final objective was to help Welsh mSMEs in sustaining and growing their businesses by integrating the commercial use of their IP assets into their overall business plans.

Following the launch of IP Wales in June 2002, more than two thousand Welsh mSMEs became members, responding to the promotional message that IP assets can be used to protect and/or add value to their businesses. Of these, over seven hundred and fifty

* The author is the Director of IP Wales and Head of Department of Professional Legal Studies at Swansea University, UK. He was the recipient under the Queen's Birthday Honours List 2009 of an O.B.E. for "Services to intellectual property and businesses in Wales". Previously a Consultant to the World Intellectual Property Organization he now works as a Consultant to the Intellectual Property team at Capital Law Solicitors (Cardiff).

requested strategic IP advice resulting in more than one hundred client firms receiving assistance in securing two hundred and five patents, sixty trademarks, and twelve industrial designs around the world.² The Project also helped to secure financial support for twenty-five IP licensing deals.

IP Wales made the following findings during this first phase of operation. First, the main ingredients for the success of a knowledge based mSME are management, finance, and access to advanced technology and 'know-how'. Second, experience demonstrated that a better management team will make better commercial use of a poorer technology than a poorer management team will make of a better technology. Third, financing will always seek out good management teams. Consequently, the focus for the next phase of operation has become the promotion of better Intellectual Assets (IAs) Management. To this end, IP Wales has worked with the World Intellectual Property Organization (WIPO) to produce the following Guides for mSMEs:-³

- Understanding Open Innovation
- Understanding Intellectual Assets
- Establishing the Legal Freedom to Operate in your Market Place
- Restricting Competitor Access to your Market Place
- Extracting Added Value from your Intellectual Assets

Vision for a new Welsh knowledge economy with IP at its core

In September 2008, Wales hosted a WIPO-organized conference for national Intellectual Property Offices and IP specialists from the Organization for Economic Co-operation and Development (OECD) countries.⁴ At the Gala Dinner, the First Minister of the Welsh Assembly Government set out a vision for a new knowledge rich economy for post devolution Wales.⁵ This vision set forth an economy with IP at its core, driven by a University research base anchored in science, technology, engineering, and mathematics (STEM). The scale of the task in implementing this vision is not to be underestimated.

In March 2008, the then Secretary of State for Innovation, Universities, and Skills, sought advice from the Vice Chancellor of Lancaster University on how UK universities should manage their IP for their own benefit and that of the wider economy. Professor Paul Wellings reported that compared to counterparts in Australia, Canada and USA, the performance of UK universities is 'good and improving'.⁶

² Motivation for mSMEs contacting IP Wales: 39% patent enquiries, 25% general IP enquiries, 15% trade mark enquiries, 12% copyright enquiries, 6% licensing enquiries, 3% industrial design enquiries.

PraxisUnico commercialization surveys demonstrate a clear correlation between large research incomes derived from research funding/grants and the strongest commercialization performance.⁷

Yet research conducted by IP Wales paints a somewhat less dynamic picture for UK regional universities.⁸ This work formed the basis of a comparative analysis of patenting activity by universities serving the three recently devolved jurisdictions of Scotland, Wales, and Northern Ireland.⁹ While patent filings per researcher in Wales may be on a par with that of Scotland and double the rate of Northern Ireland, the academic research base in Wales is only around half that of Scotland in per capita terms. Furthermore, it is currently dominated by the performance of Cardiff University.

The current research base in Wales is too weak and fragmented to successfully drive a knowledge economy

Cardiff University stands as Wales' sole representative within the self-selecting 'Russell Group' of leading UK research universities. Therefore, the dramatic drop in its research ranking from 8th in 2001 to 22nd in 2008 is at best, discouraging.¹⁰ Moreover, this outcome resulted from the university's failure to submit a third of eligible research staff for scrutiny. This resulted in the lowest percentage submission within the top thirty UK universities.

The total number of researchers submitted on behalf of Wales under the Research Assessment Exercise (RAE) in 2008 was 2578.¹¹ This was in comparison to 6576 from Scotland¹² and 1265 from Northern Ireland¹³. Of the ten Welsh universities which were part of the exercise, only four managed to achieve double digits in the percentage of their submissions deemed to be of the highest research quality. This premier ranking was reserved for research regarded as 'world leading in terms of originality, significance, and rigour'.

Moreover RAE 2008 revealed a massive Welsh deficit when compared with Scotland in terms of world class STEM research. Wales has less than one hundred and twenty researchers operating in this field at the highest level, with nearly 80% of these based at the leading engineering departments of Cardiff University and Swansea University.

The new sector-based approach to Economic Development in Wales has yet to be anchored within the patent strength of Welsh Universities

¹³ Over 60% from Queens University.

In their new approach to Economic Development, the Welsh Assembly Government's Ministerial Advisory Group identified fourteen key sectors for Wales. Three were deemed to be core enabling sectors (energy, environmental management, telecommunications and information communications technology – ICT); six were considered strategically important (bio-science, health, financial and professional services, creative industries, automotive, aerospace); and five were considered to have an economic importance (construction, food, defence, retail, leisure and tourism).

The move towards a new sector-based approach to supporting businesses in Wales was endorsed in the Welsh Assembly Government's, '*Economic Renewal: a New Direction*'.¹⁴ Four R&D priority areas were cited for Welsh Universities, namely the Digital Economy (ICT), Low Carbon Economy (including climate change mitigation and adaptation), Health & Bioscience, and Advanced Engineering and Manufacturing.

However, these selected sectors are not reflective of Welsh universities' traditional areas of patent strength. When IP Wales investigated UK university patent holdings¹⁵ it showed a concentration of technologies in Human Necessities (medicines and devices), Chemistry and Metallurgy (genetic engineering and microbe testing), Physics and Electricity (lasers). Welsh universities showed particular strength in the fields of chemical and physical analysis, and microbe testing. In relative terms, Wales' weakness was most pronounced in electronics and communications.

The Welsh Assembly Government has recently established six Sector Panels to advise on opportunities in its priority industries of Digital Economy, Energy and Environmental, Life Sciences, Advanced Materials and Engineering, Creative Industries, and Financial and Professional Services. An external SME Panel is also to be created to advise these six Sector Advisory Panels.

This new approach is significant because the use of IP can vary substantially between sectors. For example, ICT requires a rapid transfer of 'know-how' into its products. On the other hand, creative industries look for the transfer of skilled people into multi-disciplinary teams, while life sciences and the pharmaceutical sector demand strong IP protection.

There is little evidence to suggest that the current Welsh Universities/mSME interface is facilitating effective commercialization of university research

The Gibson Review defined commercialization as, 'publicly funded activities by which IP created within the Higher Education Institutions sector can form the foundations for the

¹⁵ Op. Cit. 8.

creation of value'.¹⁷ The seminal Lambert Review explored better two-way collaboration between industries and universities, and reached three main conclusions. First, universities need to better identify their areas of competitive strength. Second, the UK government would have to do more to support business collaboration with academic institutions. Third, businesses will have to learn how to exploit the innovative ideas that are being developed within these academic institutions.¹⁸

Forward citation analysis can be a useful indicator of commercial interest in the technology.²⁰ In this regard, research from IP Wales reveals that the performance of Welsh university patents has been notably poorer in recent years.²¹

Moreover, the recent announcement of the Welsh Assembly Government to close down six out of its ten flagship projects within the Technium network²², previously at the core of its policy to generate an improved business and university interface, has been viewed by political opponents as a long overdue admission of policy failure.²³ However this decision resulted from an internal audit which is reported to have identified government department 'management weaknesses' and the former Economic Development Minister remains of the view that the underlying concept was very sound.²⁴

UK Government review on how IP can drive innovation and economic growth in the UK

Prime Minister David Cameron has announced that Ian Hargreaves, the newly appointed Professor of Digital Economy at Cardiff University, is to lead a UK government review of how intellectual property can drive economic growth and innovation.²⁵ In the previous year Hargreaves led a review of the Creative Industries in Wales for the Welsh Assembly Government.²⁶ The current review is expected to report its findings in April 2011. It has been given the task of investigating barriers to new internet based business models, the cost and complexity of enforcing intellectual property rights, the interaction between
