

# Deep learning methods to detect radical online content

#TASMConf | SWANSEA UNIVERSITY | 26.06.19

Presented by Dr. Berta Biescas

### INTRODUCTION: INVISO

#### Novel Social Data Mining Platform to Detect and Defeat Violent Online Radicalisation

- Provides a novel solution for LEA analysts to detect terrorist propaganda on social media
- Identifies radical content, suspicious messages and covert radicalisation processes with the help of sophisticated text mining algorithms.
- Relies on deep learning to develop automatically new models which can be used to detect other criminal activity as well.

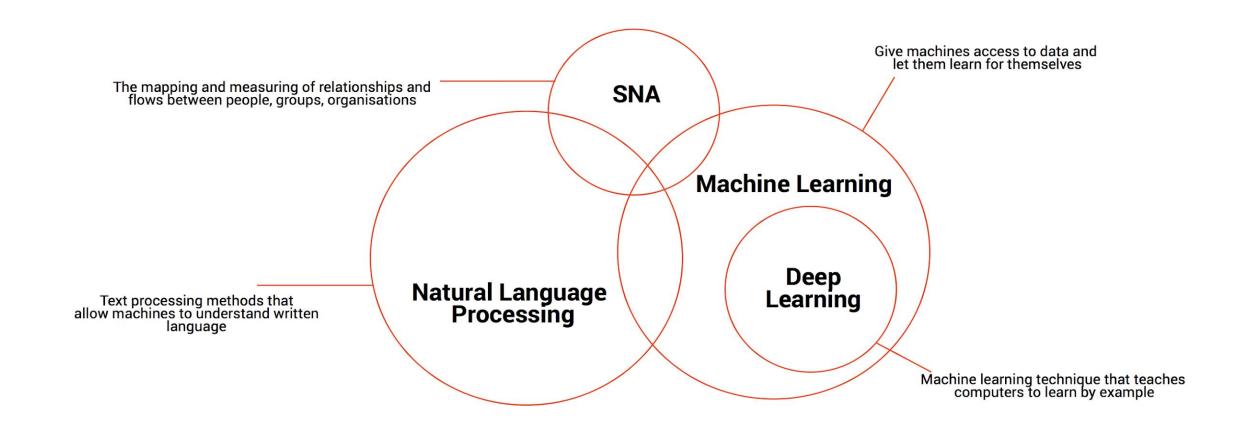

#### **Scientific Pillars**

#### **Analytical Methodologies**

#### NATURAL LANGUAGE PROCESSING (NLP)

- ☐ Topic classification using deep learning domain
- Sentiment analysis using lexicon methods
- ☐ Key ideas based on pos tagging and linguistic theory.
- Hashtags recognition
- → Entities extraction
- Personality insights extraction.
- Concepts extraction using pos tagging and linguistic theory.
- Expertise in English, Arabic and Spanish languages.
- □ Deep Learning Models
- Transfer Learning

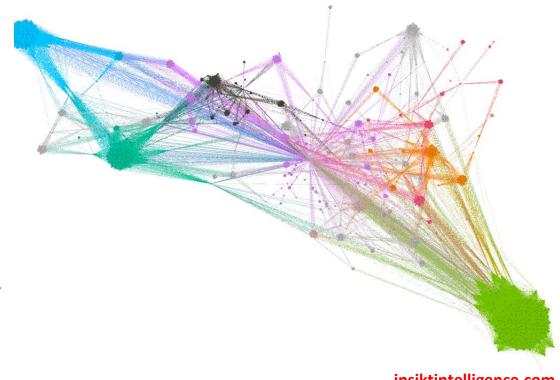

#### **Analytical Methodologies**

#### **MACHINE LEARNING**

- Text classification using supervised models, deep learning and lexicon models.
- Word mapping design.

#### SOCIAL NETWORK ANALYSIS (SNA)

- Analysis of clusters. Networks of concepts
- Analysis of mentions, Analysis of text similarities.
- Detection of influencers. retweets, replies, etc.

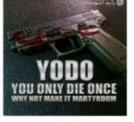

#### **HOW INVISO HELPS**

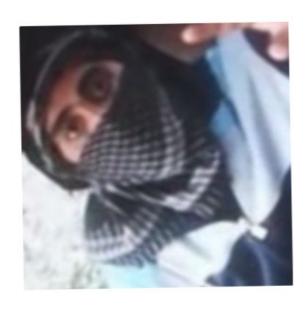

- INSIKT is a novel radicalisation detection technology, based on live semantic analysis of big data social media streams.
- To detect radicalisation activities very early (as they are taking place) and limit spread of radical content.
- To detect when terrorist or other radical groups are recruiting or releasing their propaganda.
- To detect suspicious user behaviour, identify hubs of radicalisation and intervene.

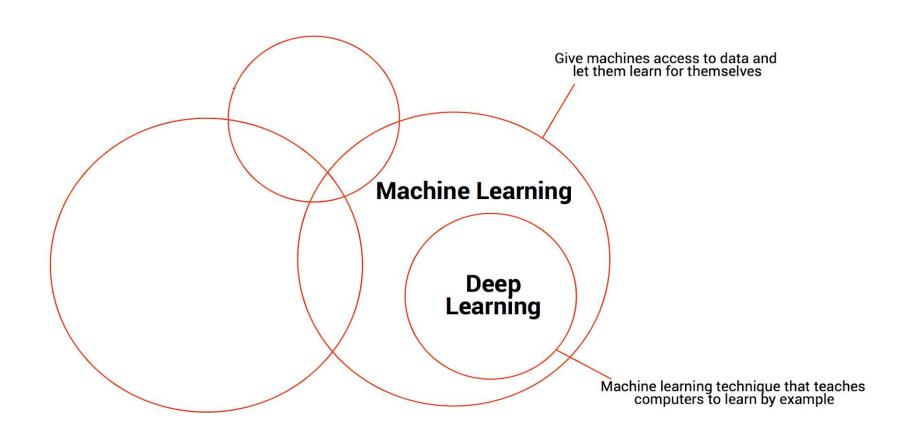

Detection of users exposed to radicalisation processes

#### Deep learning methods to detect radical content online

## DEEP LEARNING

#### MACHINE LEARNING

**TEXT CLASSIFIER** 

#### Supervised learning - Annotated Corpus

Non suspicious - LO

Suspicious support for radical actions, recruitment, fundings - L1

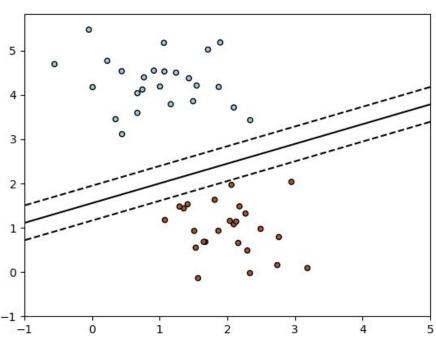

Follow extremism ideas - L1

Joy for terrorism attacks/support radical people - L1 Call to action/support of terrorism attacks - L1

#### **SGD CLASSIFIER**

| Word vector     | Accuracy<br>English classifier | Accuracy Arabic classifier |
|-----------------|--------------------------------|----------------------------|
| generic         | 74.6 +- 2.2                    | 77.7 +- 1                  |
| Jihadist domain | 75.3+-1.2                      | 79.6+-0.7                  |

### TRANSFER LEARNING

WITH ALIGNED WORD VECTORS

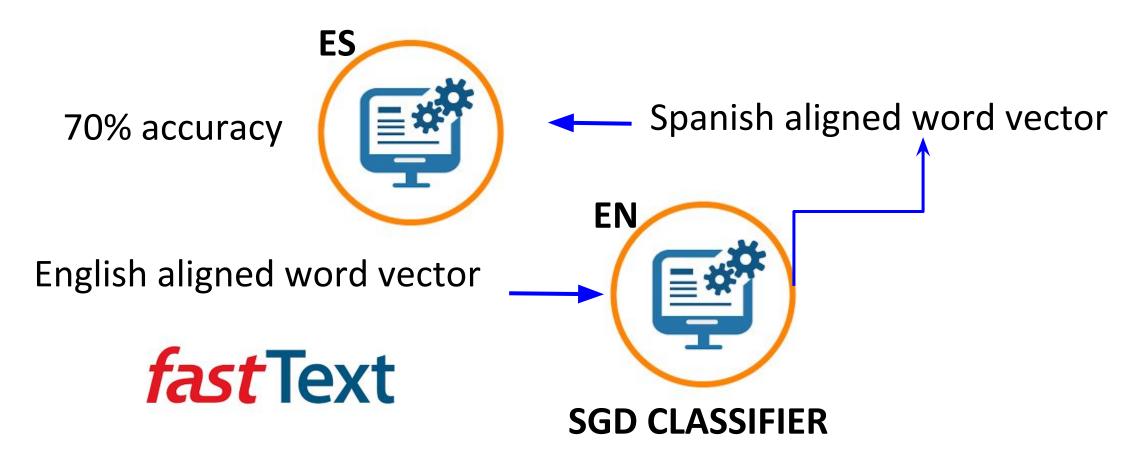

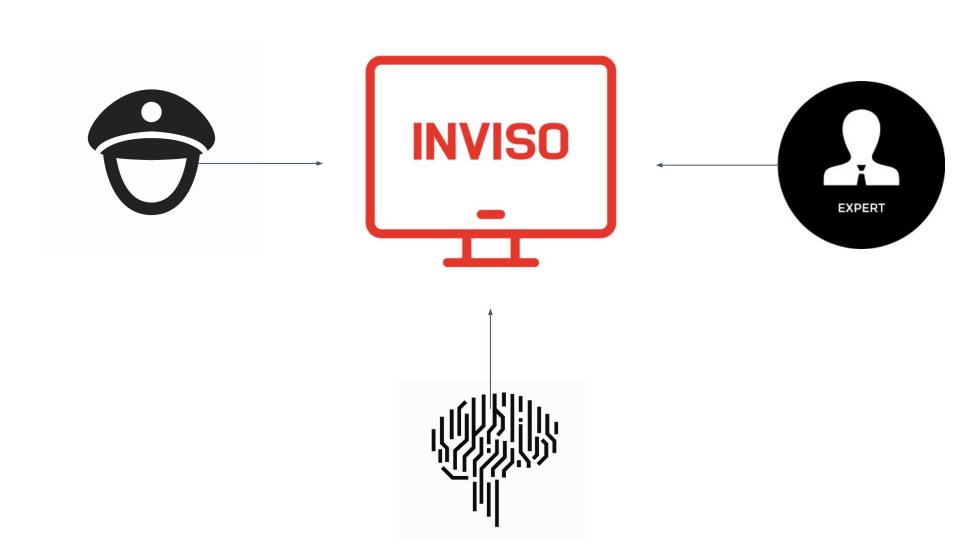

#### **Transfer Learning + Aligned word vectors+ SGD CLASSIFIER**
